What is POS tagging?

[Ambiguity Examples.](#)[New chat](#)[Use case modeling.](#)[Software Complexity Expl](#)[Types of POS tagging.](#)[Bayesian Method in NLP.](#)[POS Tagging Explai](#)[Ambiguity in NLP.](#)[New chat](#)

POS tagging stands for Part-of-Speech tagging. It is a natural language processing technique that involves assigning a grammatical tag to each word in a sentence, indicating its part of speech. Part-of-speech refers to the syntactic category or function of a word in a sentence, such as noun, verb, adjective, adverb, pronoun, preposition, conjunction, and interjection.

POS tagging is an important task in natural language processing and is often used as a preprocessing step for various applications such as information retrieval, machine translation, sentiment analysis, and text classification. POS tagging can help disambiguate word meanings and improve the accuracy of downstream NLP tasks by providing more context and structure to the text.

There are various algorithms and techniques for POS tagging, ranging from rule-based methods that rely on hand-crafted rules to statistical and machine learning-based approaches that use probabilistic models and large annotated corpora.
